

What is a Body Trap?

Body Traps, also known as Body Grip Traps, are used mainly for population and pest control. When triggered by the animal, the trap collapses onto the animals body and the rotating jaw quickly traps and humanely kills the animal.

Pictured on the right is a diagram showing the different parts of a Duke Body Trap.

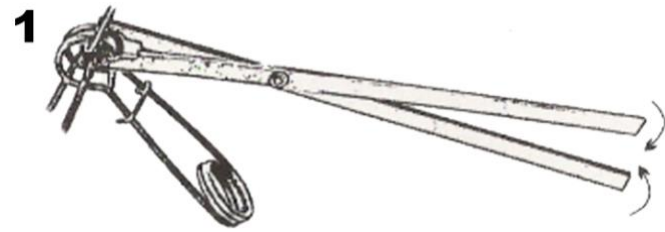

To set up larger Body Traps such as the Duke 220 and Duke 330 Traps you will need a Setting Tool.

How to Set up a Duke Body Trap

The first thing you would do is extend the double springs away from the rotating jaws of the trap using a Trap Setting Tool. Do **NOT** remove the Trap Setting Tool until you have finished completely setting up your Trap. See below for step-by-step instructions on how set up your trap.

1. Hook each notched end of the Duke Trap Setting Tool into the eyes of the springs.

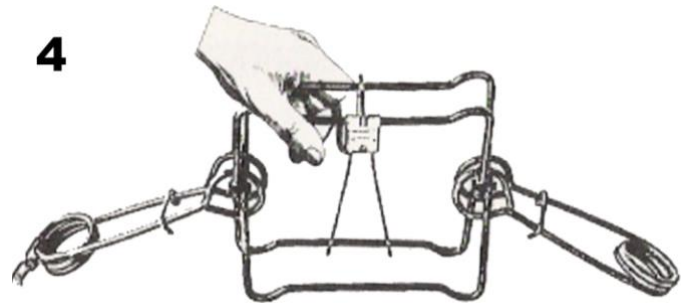

2. Using a scissor action, compress the spring and set the safety hook to keep the spring compressed.

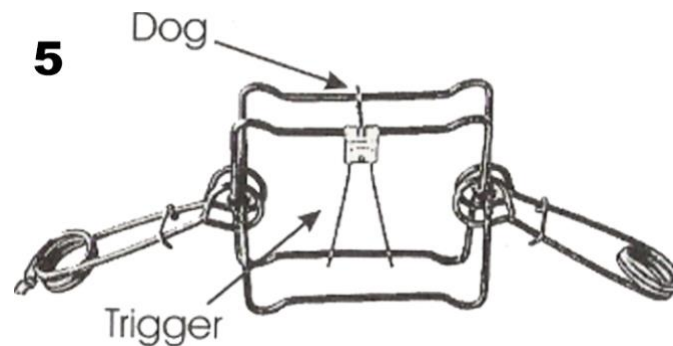

3. Repeat step for the opposite spring.

4. While the springs are compressed bring the trap jaws together.

5. Place the "Dog" into the notch of the trigger.

6. Trap is now completely set up. Make sure the safety hooks are in place until you are completely finished setting up the trap.
