

Oxygen Absorber Indicators

Each Oxygen Absorber Package includes one *Oxygen Indicator* which is represented as a small pink dot. The **pink** oxygen indicator is a visual confirmation that your package contains fresh oxygen absorbers and will do its intended job when used. The colour of the indicator may vary from bright pink to a reddish hue indicating that the package is properly sealed and that there is no oxygen in the package. Once the package is opened and exposed, you will notice the indicator rapidly changing to blue. Please keep in mind that it does not mean your oxygen absorbers are compromised, oxygen absorbers can absorb a large quantity of oxygen and still be effective. The pink indication simply means no oxygen is present in its environment and blue means that oxygen is still present in its environment. Once all oxygen is absorbed from its environment the indicator will regain its pink/reddish hue. This could take up to a day or more.

What if the oxygen indicator is not quite pink nor blue, but more purple?

This may sometimes be the case when the oxygen absorbers have been recently packed and shipped promptly to its destination and since it takes Indicators over a week to become pink customers may receive indicators of this colour. If the package is not damaged and is still vacuum sealed when you receive it the indicators should start turning pink which could take up to a day or more. You can check the freshness of oxygen absorbers by feeling them. They will feel like fine powder if they are uncompromised but hard and crunchy if exposed.
